

Overview

ISD provides a wide array of inspection services for residential, commercial businesses, power generation facilities, manufacturing plants, municipalities, contractors and homeowners to identify, repair and protect homes, buildings, electrical components, mechanical equipment, and structures from moisture, leaks, corrosion, improper installation, and inefficient use of energy.

Electrical Surveys

- Commercial & industrial businesses are often asked by insurance companies to conduct an infrared electrical scan inspection as a risk management tool. During an infrared electrical inspection, elevated and abnormal temperatures are located and reported before service interruption, equipment damage, or a complete failure occurs.
- MCC's, transformers, breaker panels, switch gear, control panels and other electrical gear are inspected. The findings are detailed in an IR thermography report including the thermograms.

Home/Office/Building Surveys

- These inspections can identify and investigate moisture intrusion, causes of high energy bills, localized and general comfort concerns, and harboring pests such as termites, rodents, wasps, etc. in the structure. Water leaks, radiative heat system leaks and blockages, and improperly insulated walls and ceiling can also be identified.

Contact Us

- Allow our complete industrial, commercial, and residential surveys help you conserve energy (lower energy bills) and reduce lost production time due to unplanned equipment failure (increase plant efficiency).
